

ASX Code: VTX

Advanced Hill End Gold Project (NSW)  
34km strike length high grade gold system –  
to be developed on a large scale - 1.6m ozs  
historically mined.

Advanced Hargraves Gold Project (NSW)  
moving to a PFS.

Combined existing 2012 JORC 484K oz @  
3.28 g/t. Significant exploration upside  
likely to be amenable to gravity recovery,  
with recoveries potentially as high as 95%.

Highly prospective Pride of Elvire Gold Project  
(WA) & Taylors Rock Nickel Gold Project  
(WA).

Hill End is home to the largest gold reef  
nugget ever found – world record.

## Drill results for Red Hill and Hargraves

ASX ANNOUNCEMENT 09 FEBRUARY 2023

### KEY HIGHLIGHTS:

- Drill results received from Vertex's first infill drilling at Hargraves and last holes drilled at Red Hill.
- Hargraves Hole VHRGD001 Gold Intercepts include;
  - 1m @ 4.58 g/t from 48m
  - 1m @ 1.06 g/t from 78m
  - 1m @ 1.51 g/t from 126m
  - 7m @ 1.72 g/t from 180m including
  - 3m @ 3.60 g/t from 180m including.
  - 1m @ 7.33 g/t from 181m
  - 7m @ 1.90 g/t from 192m including.
  - 1m @ 9.29 g/t from 192m
  - 1.5m @ 1.34 from 203m
  - MINERALISATION REMAINS OPEN.
- Red Hill Hole VRHD009 Gold Intercept
  - 5m @ 1.13 g/t from 25m including.
  - 1m @ 2.41 g/t from 25m
- Red Hill holes 10 and 11 targeted an area to the north east of the known Red Hill mineralisation with no significant intersections. Said holes provide important structural/future targeting information.
- Diamond drilling results for one of three holes drilled by Vertex on the recently granted EL 9485 (an area that previously divided the Hargraves Mineral Resource.
- The area constitutes >10% of the strike length of the Hargraves Mineral Resource. The Company anticipates to quickly add to the mineral inventory and is confident of joining the two resources previously considered two separate mines.
- Hargraves 2012 JORC Resource Estimate today stands at 2.3 million tonnes at 2.4 g/t Au for 177,000 ozs Au.
- The drill intercepts and structures immediately adjacent to the drill target show spectacular intercepts shown in Figure 2 including;
  - 6m at 60.45 g/t Au (hole H17)
  - 2m at 27.65 g/t Au (hole H6)
  - 2m at 10.45 g/t Au (hole H6)
  - 2m at 14.29 g/t Au (hole H17).

Vertex Minerals Limited (ASX: VTX) (“Vertex” or the “Company”) is pleased to announce drilling results from the last of the Red Hill program and the first hole at Hargraves, at the recently granted EL 9485, which is, in turn, entirely surrounded by the company’s existing EL6996.

**Figure 1 – Plan view of EL9485**

There has been no systematic exploration on EL9485 for many decades. It is considered highly prospective for continuation of quartz veins containing very high gold grades. Figure 2 illustrates Section A-A, which is

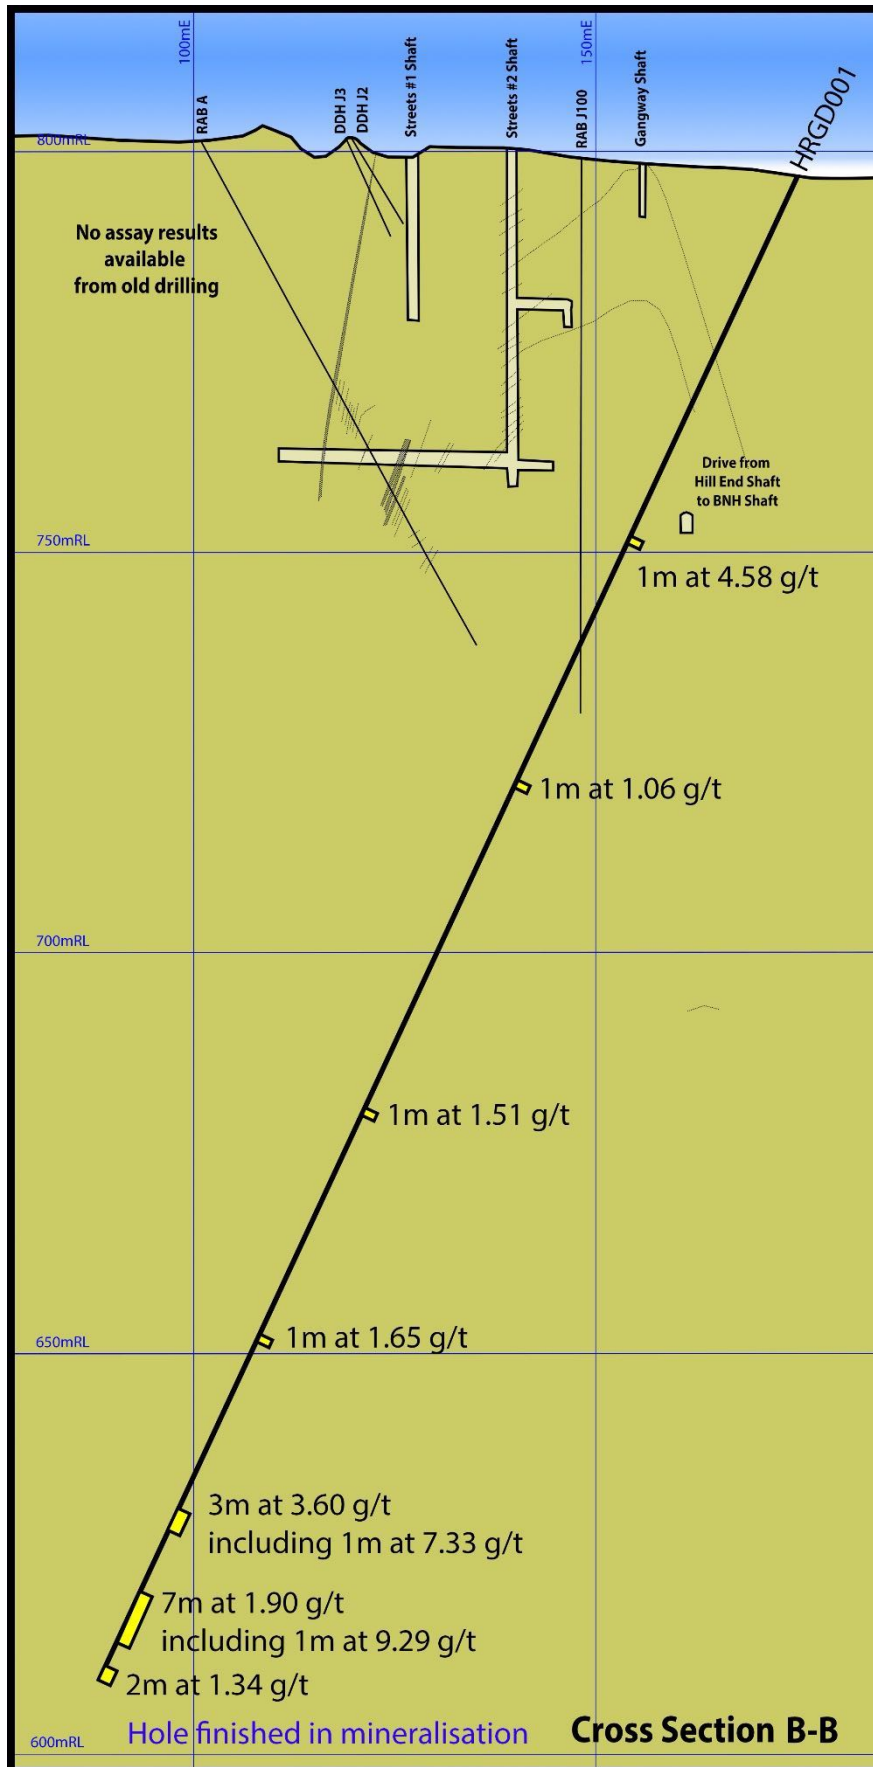

on the Company's EL6996 and adjacent to the first Vertex drill hole at Hargraves and the new exploration license.

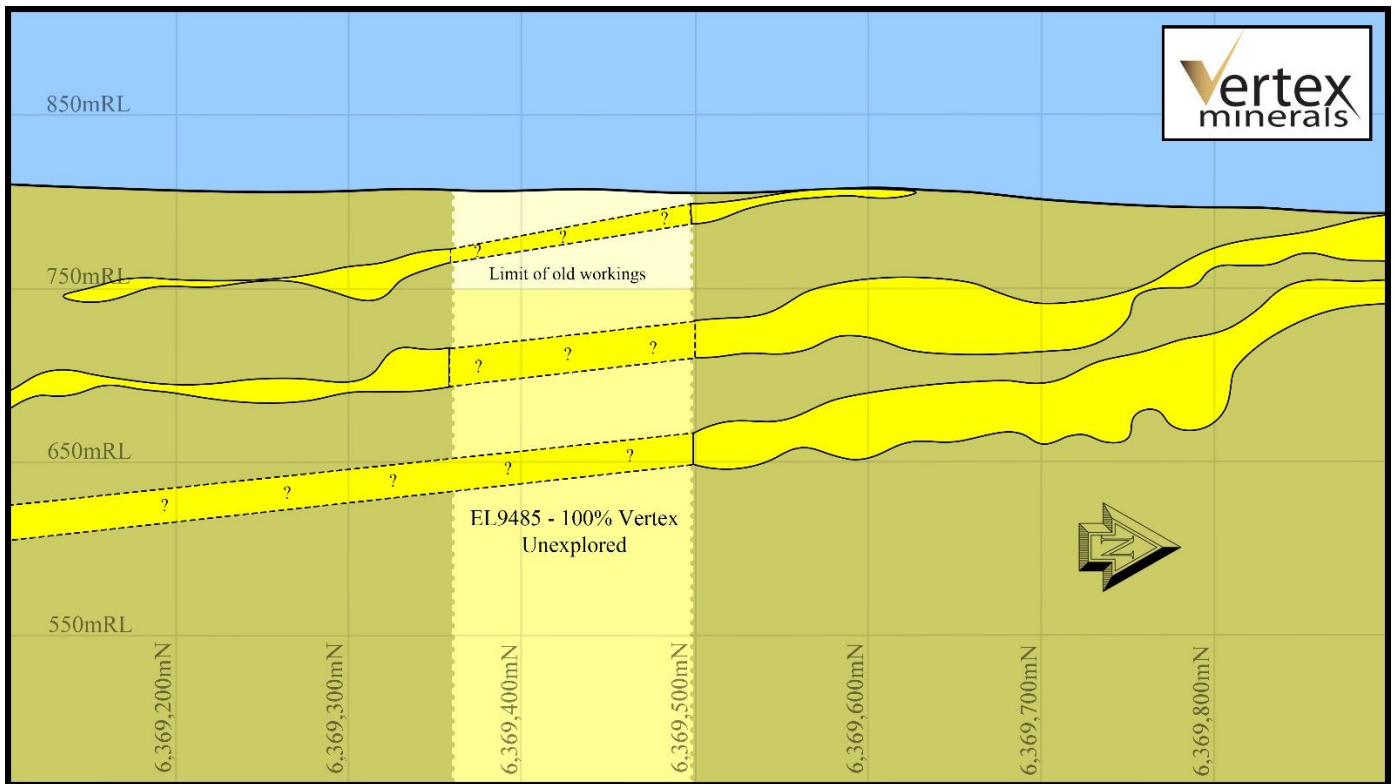

**Figure 2 - Section A-A showing geology and drilling**

The Section A-A shows a geological interpretation and the assay results from past drilling programs. Figure 3 illustrates Section B-B, which is a cross section through the new EL9485 and showing HRGD001, the first

hole drilled by Vertex at Hargraves, with the down plunge continuation of quartz veining that represents the exploration target on EL9485.

This down plunge extension of quartz veins is well founded at Hargraves, with an extensive drill database that supports the southerly plunge of the vein system. This trend is illustrated in Figure 4, and shows the upper exploration target where some depletion from historic mining is to be expected, plus two deeper exploration targets. The middle target is supported by drill data on either side of EL9485.

**Figure 4 – Long section looking west of Hargraves Resource showing exploration potential.**

The Hargraves drilling program is the Company’s second drill program. Hargraves presents great potential for significant resource growth. The Company believes that there is compelling evidence that the Hargraves deposit is a robust deep plunging deposit, and the gold inventory will benefit from additional drilling.

The Mineral Resource of the Hargraves Project stand at 177,000 ounces and is detailed in Table 1.

**Table 1 - Hargraves 2012 JORC Resource**

Category (0.8 g/t Cut Off)	Tonnes	Gold Grade (g/t)	Contained Gold (oz)
Indicated	1,108,651	2.7	97,233
Inferred	1,210,335	2.1	80,419
<b>Total Resource</b>	<b>2,318,986</b>	<b>2.4</b>	<b>177,652</b>

**Executive Chairman Roger Jackson commented:**

*“The results from our recent drilling are further building the story towards Vertex rerunning the resources numbers and pegging the project as MLs. We are keen to take these projects to production, whilst building the greater Hill End corridors global gold inventory”*

**Table 2 – Hill End Project Mineral Resource Estimate**

Deposit	Classification	Tonnes (kt)	Grade Au (g/t)	Contained Au (koz)

## About Vertex Minerals Limited

Vertex Minerals Limited (ASX: VTX) is an Australian based gold exploration company developing its advanced Hargraves and Hill End gold projects located in the highly prospective Eastern Lachlan Fold Belt of Central West NSW. Other Company assets include the Pride of Elvire gold project and Taylors Rock gold/nickel/lithium project both located in the Eastern Goldfields of WA. The focus of Vertex Minerals is to advance the commercial production of gold from its NSW projects embracing an ethical and environmentally sustainable approach:

- **Gravity Separation:** The deportment of gold at the Hill End Project allows high recovery to a concentrate produced using gravity separation techniques.
- **Direct Smelting:** The use of direct smelting of a gold concentrate that eliminates the need to use cyanide as a solvent.
- **Contrast in Density:** These separation techniques take advantage of the contrast in density of gold ( $\rho=19.3$ ) relative to quartz ( $\rho=2.65$ ).
- **Renewable Energy Potential:** The unique landscape and infrastructure makes Hill End ideal for the establishment of renewable sources of power. The Crudine Ridge Windfarm is only 30km from the project site and Vertex plans to examine a pumped hydro-electricity scheme as an integral part of any proposed development. The topography and existing mine workings including shafts and adits make the establishment of a pumped hydro scheme achievable at modest expense.
- **Benign Tailings:** The tailings will essentially be quartz with little to no sulphide minerals.

### Hargraves Gold Project (NSW)

- Hargraves Gold project is located approximately 2.5 km south of the town of Mudgee.
- The goldfield is 4 x 10 km with numerous mineralised structures with little modern exploration.
- An updated mineral resource in accordance with JORC 2012 Code was completed by SRK Consulting (Australasia) Pty Ltd (SRK) – total of **2.3Mt at 2.38g/t Au for 177koz Au**.

### Hill End Gold Project (NSW)

- Consists of 10 mining leases and three Exploration Licences located in the core of the Hill End Trough on the eastern Lachlan Fold Belt.
- 14km of continuous gold lode with gold recovery rate to gravity at +90%.
- Work undertaken in 2015 by Hill End Gold Limited (HEG) culminated in a JORC 2012 resource estimate of **80,000 oz Au @ 1.7 g/t to 150m depth**.

### Pride of Elvire Gold Project (WA)

- Tenements surround the Mt. Elvire homestead approximately 210km north of Southern Cross in Western Australia
- The project has seen historical drilling with encouraging gold results achieved.

### Taylors Rock Project (WA)

- Located 80km WSW of Norseman in the Southern Goldfields region of Western Australia.
- The project has both Gold and Nickel potential, interesting historical intercepts have recorded encouraging mineralisation.

## JORC Compliance Statements

This announcement contains references to Mineral Resource estimates, which have been extracted from previous ASX announcements. These include announcements made by Peak Resources Ltd (ASX:PUA), the parent company of VTX prior to the Company's separate listing in 2022. The Resource estimate for the Reward deposit was announced by Vertex on 23 November 2022. For full details of Exploration Results in this release that have been previously announced, refer to those announcements.

The Company confirms that it is not aware of any new information or data that materially affects the information included in the said announcements, and in the case of estimates of Mineral Resources, that all material assumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Persons' findings are presented have not materially modified from the original market announcements.

## Competent Persons Statement

The information in this report that relates to Exploration Results and Exploration Targets is based on information compiled by Mr. Roger Jackson, a Director and Shareholder of the Company, who is a 25+ year Fellow of the Australasian Institute of Mining and Metallurgy (FAusIMM), Member of the Australasian Institute of Geoscientists and a Member of Australian Institute of Company Directors. Mr. Jackson has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves". Mr. Jackson consents to the inclusion of the data contained in relevant resource reports used for this announcement as well as the matters, form and context in which the relevant data appears.

#### **Forward Looking Statements and Important Notice**

This report contains forecasts, projections and forward-looking information. Although the Company believes that its expectations, estimates and forecast outcomes are based on reasonable assumptions it can give no assurance that these will be achieved. Expectations and estimates and projections and information provided by the Company are not a guarantee of future performance and involve unknown risks and uncertainties, many of which are out of Vertex Minerals' control.

Actual results and developments will almost certainly differ materially from those expressed or implied. Vertex Minerals has not audited or investigated the accuracy or completeness of the information, statements and opinions contained in this announcement. To the maximum extent permitted by applicable laws, Vertex Minerals makes no representation and can give no assurance, guarantee or warranty, express or implied, as to, and takes no responsibility and assumes no liability for the authenticity, validity, accuracy, suitability or completeness of, or any errors in or omission from, any information, statement or opinion contained in this report and without prejudice, to the generality of the foregoing, the achievement or accuracy of any forecasts, projections or other forward looking information contained or referred to in this report.

Investors should make and rely upon their own enquiries before deciding to acquire or deal in the Company's securities.

<ul style="list-style-type: none"> <li>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g., 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g., submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>HEG RC drill hole samples were weighed and moisture contents recorded to measure the representativity of the samples. Where samples are recorded as significantly overweight (&gt;33 kg) or underweight (&lt;15 kg) or the sample is wet, the interval is considered unrepresentative</li> <li>Gold at Hargraves is contained in quartz veins reactivated and re-mineralised by repeated hydraulic fracturing events accompanying deformation and metamorphism. Samples of quartz commonly contain gold, but not all quartz contains gold.</li> <li>Numerous samples of altered and sulphide mineralised host rock have been collected and analysed for gold by various methods. None of these samples contain gold &gt; 0.1 ppm. Consequently, following geological logging, only RC and DD core samples containing quartz veining were collected and sent for gold assay.</li> <li>RC samples collected over 1 m intervals and logged as containing quartz were collected at the drill rig in plastic bags. Quarter sub-samples were riffle split at the drill site and placed in a separate plastic bag in preparation for transport to the laboratory.</li> <li>DD core samples that are logged as containing quartz veins were sub-sampled over geologically determined intervals. The core interval to be sampled was cut longitudinally with a diamond saw and one half of the core was placed in a calico bag in preparation for transport to the laboratory.</li> </ul>																																																																																		
<b>DRILLING TECHNIQUES</b> <ul style="list-style-type: none"> <li>Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, face-sampling bit, or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>Drilling is a combination of diamond core (HQ and HQ3) and RC (114, 138 and 108 mm diameter) techniques.</li> <li>HQ (63.5 mm diameter) diamond core was collected by Challenger Mining in 1987-88.</li> <li>HQ3 (triple tube) drilling (61.1 mm diameter) was collected from all HEG drill holes.</li> <li>Oriented core was collected using a Reflex Act II HQ3 orientation tool in all the drill holes completed by HEG in 2012, over the North BNH drill program.</li> </ul> <table border="1"> <thead> <tr> <th rowspan="2">Company</th> <th rowspan="2">Year</th> <th colspan="2">DD</th> <th colspan="2">RC</th> <th colspan="2">Total</th> </tr> <tr> <th>#Holes</th> <th>Meterage</th> <th>#Holes</th> <th>Meterage</th> <th>#Holes</th> <th>Meterage</th> </tr> </thead> <tbody> <tr> <td>Challenger</td> <td>1987</td> <td>12</td> <td>1560.3</td> <td>34</td> <td>2310.2</td> <td>46</td> <td>3870.5</td> </tr> <tr> <td>Geoservices</td> <td>1993</td> <td></td> <td></td> <td>27</td> <td>1900</td> <td>27</td> <td>1900</td> </tr> <tr> <td rowspan="5">Hill End Gold</td> <td>2008</td> <td>19</td> <td>4230.4</td> <td></td> <td></td> <td>19</td> <td>4230.4</td> </tr> <tr> <td>2009</td> <td>22</td> <td>3749.34</td> <td></td> <td></td> <td>22</td> <td>3749.34</td> </tr> <tr> <td>2010</td> <td>50</td> <td>9245.5</td> <td></td> <td></td> <td>50</td> <td>9245.5</td> </tr> <tr> <td>2011</td> <td>1</td> <td>211.2</td> <td>47</td> <td>2466</td> <td>48</td> <td>2677.2</td> </tr> <tr> <td>2012</td> <td>23</td> <td>2720</td> <td></td> <td></td> <td>23</td> <td>2720</td> </tr> <tr> <td><b>Total</b></td> <td></td> <td><b>115</b></td> <td><b>20156.44</b></td> <td><b>47</b></td> <td><b>2466</b></td> <td><b>162</b></td> <td><b>22622.44</b></td> </tr> <tr> <td><b>Grand Total</b></td> <td></td> <td><b>127</b></td> <td><b>21716.74</b></td> <td><b>108</b></td> <td><b>6676.2</b></td> <td><b>235</b></td> <td><b>28392.94</b></td> </tr> </tbody> </table>	Company	Year	DD		RC		Total		#Holes	Meterage	#Holes	Meterage	#Holes	Meterage	Challenger	1987	12	1560.3	34	2310.2	46	3870.5	Geoservices	1993			27	1900	27	1900	Hill End Gold	2008	19	4230.4			19	4230.4	2009	22	3749.34			22	3749.34	2010	50	9245.5			50	9245.5	2011	1	211.2	47	2466	48	2677.2	2012	23	2720			23	2720	<b>Total</b>		<b>115</b>	<b>20156.44</b>	<b>47</b>	<b>2466</b>	<b>162</b>	<b>22622.44</b>	<b>Grand Total</b>		<b>127</b>	<b>21716.74</b>	<b>108</b>	<b>6676.2</b>	<b>235</b>	<b>28392.94</b>

		<ul style="list-style-type: none"> <li>Challenger Mining (1987-88) 100% of the DD core was logged following mark-up for core recovery and RQD (1,560.3 m).</li> <li>Compass Resources NL in JV with Geoservices Pty Ltd (1993-94) 100% of the RC drill cuttings were logged for lithology, mineralisation and alteration (1,900.0 m).</li> </ul>
SUB-SAMPLING TECHNIQUES AND SAMPLE PREPARATION	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality, and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the <i>in-situ</i> material collected, including for instance results for field duplicate/second-half sampling.</li> </ul>	<ul style="list-style-type: none"> <li>Sawn and halved for sampling</li> <li>No non-core drilling has been undertaken. RC drilling was suspended.</li> <li>Half core and quarter were submitted for assaying</li> <li>The sample and sub-sample collection, storage, transport and analysis is appropriate for the style of mineralisation at Hargraves.</li> <li>There is little detail from previous explorers to gauge the sampling quality control procedures.</li> <li>HEG drill core sample intervals are selected by the geologists that log the core and who have experience in the style of mineralisation being sampled. Cutting of the core, sample numbering and placing the ½ core in the bag was undertaken by experienced field assistants under geological supervision.</li> <li>Sample checking and counting before sample dispatch to the laboratory was done by experienced field assistants.</li> <li>HEG RC samples were logged for moisture content and quarter riffle-split at the drill site before being re- bagged for dispatch to the laboratory.</li> <li>Several close-spaced drill holes have been completed in the upper part of the deposit (top 100 m) which provides a measure of the representivity of the sample. Generally, the geology replicates well across close-spaced drill holes, although the gold grades are variable over intervals up to 10 m.</li> <li>Composites greater than 10 m replicate well between drill holes.</li> <li>Challenger Mining (1987-88) - duplicate RC samples from drill holes were not possible as the whole sample from 1 m intervals was submitted for assay and pulp rejects were not retrieved.</li> <li>Where Compass Resources NL submitted previously unsampled RC chips from Challenger Mining drilling, a 3 kg sub- sample was split which did allow for duplicate sampling by different assay methods as described above.</li> </ul>

CRITERIA	JORC Code Explanation	Commentary
	<ul style="list-style-type: none"> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>Compass Resources NL (1993-94) duplicate RC samples were taken from 3 kg riffle splits for analysis by different methods as described above. No other information is available on duplicate sampling.</li> <li>Selected HEG RC sample quarter split duplicates were submitted for assay by different assay techniques (FA and LeachWell bottle roll). HEG duplicate split diamond core pulps in the laboratory for assay by different assay techniques (FA and LeachWell bottle roll). No second ½ core sample duplicates have been taken for analysis by duplicate techniques as this would not increase 50 g FA or LeachWell assay interval precision. Second ½ core composites have been selected for metallurgical testing which provides a composite measure of gold content which compares well to original assay gold content over the same composite interval.</li> <li>Sample sizes are appropriate for the style of mineralisation at Hargraves. Hargraves mineralisation contains coarse gold. Where high-grade gold is found by FA, or coarse visible gold is observed, assay procedures are modified to incorporate larger sub-samples, longer digests and optimal assay techniques.</li> </ul>
QUALITY OF ASSAY DATA AND LABORATORY TESTS	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> </ul>	<ul style="list-style-type: none"> <li>HEG RC program (2011): 1 m RC samples were quarter split in a riffle splitter and the sub-sample was transported to SGS laboratories in Townsville where the entire sub-sample was pulverized to 75 micron and analysed for gold by LeachWell (bottle roll).</li> <li>In 2012 additional samples containing previously unrecognized quartz were quarter split on site. The sub-sample was transported to SGS laboratories in West Wyalong where the entire sub-sample was pulverized to 75 microns. A 50 g fraction of the pulverized sample was then split for analysis by fire assay. For 80 samples that returned higher gold grades, the remaining pulp was sent to SGS laboratories in Townsville for gold analysis by LeachWell (bottle roll). The results correlated well for samples containing &gt; 5 ppm gold and moderately well for samples containing 0.5 - 5.0 ppm gold.</li> <li>HEG DD program (2012): Longitudinally cut ½ core samples were sent to SGS in West Wyalong or SGS in Townsville. The entire sample was pulverized to 75 microns and a sub-split sample was analysed for gold by fire assay (50 g).</li> <li>Pulverized sample from intervals that contained visible gold, or were suspected to contain high gold grades and/or returned higher gold values from the fire assay were sent to SGS laboratories in Townsville where the entire pulverized sample was analysed for gold by LeachWell (bottle roll).</li> <li>174 samples from SGS in West Wyalong and 30 samples from SGS in Townsville originally analysed by fire assay were check-assayed using the LeachWell (bottle roll) technique. The results correlated moderately well for samples &gt; 5 ppm gold and poorly for samples containing 0.5 - 5.0 ppm gold. On average the LeachWell samples reported 25% lower values than the fire assay. There is no obvious sample</li> </ul>

CRITERIA	JORC Code Explanation	Commentary
		<p>technique, or metallurgical reason for the difference in the North BNH drill core samples.</p> <ul style="list-style-type: none"> <li>● Challenger Mining (1987), CMC-1 CMC-6 (first 6 RC holes): Duplicate 50 g FA for samples from the first 6 RC drill holes using the procedure described above correlated poorly and so the sampling technique was reviewed for subsequent holes. The small (partial) sub-sample size (50 grams) for a FA of the higher- grade Hargraves material will result in loss of precision for these samples.</li> <li>● Compass Resources NL in JV with Geoservices Pty Ltd (1993-94) RC drilling program. Sub-sample and analysis by SFA improved precision. SFA results did not necessarily correlate well with visible gold observed in the sample suggesting sub-sampling (partial sample) may have been a problem in these samples.</li> <li>● 6 samples from 1994 RC drilling that were analysed by screen fire assay (SFA) were submitted for -200# SFA and by cyanide leach (approximately 6 kg). results were within expected error; however, definitive comparison of assay methods cannot be determined from 6 samples.</li> <li>● 6 samples from the 1993 drilling were submitted for cyanide leach assay. The results correlated well with the original -75# SFA; however, definitive comparison of assay methods cannot be determined from 6 samples.</li> <li>● A further 6 samples from the 1993 RC drilling were submitted for analysis by SFA (-200#). The SFA returned consistently lower assays than the original fire assay; however, definitive comparison of assay methods cannot be determined from 6 samples.</li> <li>● HEG RC and DD samples used FA and LeachWell (bottle roll) methods. LeachWell of RC samples analysed a pulverised quarter-split of the original sample which provided high precision analysis. For FA of RC samples, the entire quarter-split was pulverised, removed from the grinding equipment and split in the laboratory to provide a 50 gram sub-sample. Where gold was detected, a follow-up LeachWell gold analysis of the remaining pulp was performed for a high precision analysis. For FA of diamond core the entire sample was pulverised and split to a 50 gram sub-sample. Gold detection triggered a follow-up LeachWell gold analysis of the remaining pulp.</li> </ul>

## APPENDIX 3 - RED HILL PROJECT – JORC CODE TABLE 1 CHECKLIST OF ASSESSMENT AND REPORTING CRITERIA

### Section 1: Sampling Techniques and Data

CRITERIA	JORC Code Explanation	Commentary
SAMPLING TECHNIQUES	<ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> </ul>	<ul style="list-style-type: none"> <li>The quality of diamond coring is generally medium – high because the method is designed to sample the rock mass effectively in most conditions. Consequently, these samples can be representative of the interval drilled and can be used for Mineral Resource estimation.</li> </ul>
	<ul style="list-style-type: none"> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> </ul>	<ul style="list-style-type: none"> <li>Diamond drilling is also an established method aimed at collecting representative samples of the interval being drilled.</li> </ul>
	<ul style="list-style-type: none"> <li>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g., 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g., submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>Economic gold mineralisation is measured in terms of parts per million and therefore rigorous sampling techniques must be adopted to ensure quantitative, precise measurements of gold concentration. If gold is present as medium – coarse grains, the entire sampling, sub-sampling, and analytical process must be more stringent. Red Hill gold is coarse grained.</li> </ul>
DRILLING TECHNIQUES	<ul style="list-style-type: none"> <li>Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, face-sampling bit, or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>Diamond Drilling in HQ triple tube size were drilled at Red Hill in 2022. All holes were oriented using a Bort Longyear™ TrueCore™ Core Orientation Tool.</li> </ul>
DRILL SAMPLE RECOVERY	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: Sample recovery was measured on a per-run basis and generally reported to be greater than 95%, except where drilling in the upper, weathered, and oxidised zones. However, Vertex also reported some core loss associated with zones of alteration and mineralisation that could result in potential for sample bias.</li> </ul>
	<ul style="list-style-type: none"> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: Used chrome barrels and controlled drilling in broken ground to maximise sample recovery.</li> </ul>
	<ul style="list-style-type: none"> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul style="list-style-type: none"> <li>No assessment has been completed to determine if there is a relationship between sample recovery and grade, and whether there is any potential for sample bias associated with the drilling methods used to date.</li> </ul>

CRITERIA	JORC Code Explanation	Commentary
LOGGING	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: Drill core was logged for lithology, structure, alteration, mineralisation, and veining, which is deemed to be appropriate for the style of mineralisation and the lithologies encountered. All core was photographed. Logging information is adequate to support Mineral Resource estimation. Information to support geotechnical studies is available.</li> </ul>
	<ul style="list-style-type: none"> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: Logging of core is mostly qualitative, except for some semi-quantitative logging of sulphide content, quartz veining, RQD, and geotechnical parameters.</li> </ul>
	<ul style="list-style-type: none"> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: Geological logs were completed for all drilled intervals.</li> </ul>
SUB-SAMPLING TECHNIQUES AND SAMPLE PREPARATION	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: Vertex cut core samples in half or quarter using a diamond saw and where appropriate used geological contacts or mineralisation to define sample intervals.</li> </ul>
	<ul style="list-style-type: none"> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> </ul>	<ul style="list-style-type: none"> <li>No non-core drilling has been undertaken. RC drilling was suspended.</li> </ul>
	<ul style="list-style-type: none"> <li>For all sample types, the nature, quality, and appropriateness of the sample preparation technique.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: Half core yet to be submitted for assaying</li> </ul>
	<ul style="list-style-type: none"> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: Drill core samples of cut core were consistently taken from the same side of the orientation line on the core to maintain consistency.</li> </ul>
	<ul style="list-style-type: none"> <li>Measures taken to ensure that the sampling is representative of the <i>in-situ</i> material collected, including for instance results for field duplicate/second-half sampling.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: QA/QC procedures included the insertion of quarter core field duplicates at the insertion rate of 1 in 20 samples. Field blanks will also submitted to the laboratory.</li> </ul>
	<ul style="list-style-type: none"> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>The larger HQ3 size core was chosen to cater for the nuggety effect</li> </ul>
QUALITY OF ASSAY DATA AND LABORATORY TESTS	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> </ul>	<ul style="list-style-type: none"> <li>Gold determination was made by Fire Assay using a 50g charge which is considered appropriate yet partial. Significant intersections will be followed up by Screen Fire, which is considered total.</li> </ul>

CRITERIA	JORC Code Explanation	Commentary

CRITERIA	JORC Code Explanation	Commentary
	<ul style="list-style-type: none"> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>Nature of quality control procedures adopted (e.g., standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e., lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>No geophysical tools, spectrometers, or handheld XRF instruments have been used to date to determine chemical composition at a semi-quantitative level of accuracy.</li> <li>No samples have been dispatched to date.</li> </ul>
VERIFICATION OF SAMPLING AND ASSAYING	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> </ul>	<ul style="list-style-type: none"> <li>It has not been possible to independently verify significant intersections to date.</li> <li>There has been no use of twinned holes to date.</li> <li>Vertex drilling: Primary logging data was recorded digitally onto electronic spread sheets and validated against code tables by the logging geologist. Primary analytical data was received electronically in csv file format and imported directly into an electronic assay register spread sheet. Data validation was conducted by comparing the spreadsheet data against the Certificate of Analysis supplied as a secured pdf file by the laboratory.</li> </ul>
LOCATION OF DATA POINTS	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> </ul>	<ul style="list-style-type: none"> <li>Discuss any adjustment to assay data.</li> <li>No adjustments to assay data have been made.</li> <li>Vertex surface drilling: Drillhole collar locations were initially set out (and reported) using a handheld GPS with a location error of +/- 5m. All holes will be subsequently surveyed by contract surveyor to a sub-metre accuracy, with data supplied electronically as spreadsheets and pdf files. The azimuth and dip at the start of the hole was recorded using a line of sight</li> </ul>

CRITERIA	JORC Code Explanation	Commentary
		Suunto compass and Suunto clinometer by the site geologist. The orientation and dip of drillholes are measured with downhole surveys @ 15 m, 30 m, then every 30 m using a Bort Longyear™ TrueShot™ single/multi-shot survey tool. End of hole surveys were also taken for each hole. At hole completion, all holes were gyro surveyed. Vertex also employed a contract surveyor to survey the as-drilled drillhole collars to sub-metre accuracy.
	<ul style="list-style-type: none"> <li>Specification of the grid system used.</li> </ul>	<ul style="list-style-type: none"> <li>The co-ordinate system used is MGA94 Zone 55 Datum.</li> </ul>
	<ul style="list-style-type: none"> <li>Quality and adequacy of topographic control.</li> </ul>	<ul style="list-style-type: none"> <li>Quality of the surface topographic control data is poor and is currently reliant on public domain data. A lidar survey has been undertaken</li> </ul>
DATA SPACING AND DISTRIBUTION	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> </ul>	<ul style="list-style-type: none"> <li>The spacing of drillhole data is variable.</li> </ul>
	<ul style="list-style-type: none"> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> </ul>	<ul style="list-style-type: none"> <li>There are no Mineral Resources or Ore Reserves.</li> <li>There is insufficient drill spacing to establish the degree of geological and grade continuity appropriate for Mineral Resource and Ore Reserve estimation.</li> </ul>
	<ul style="list-style-type: none"> <li>Whether sample compositing has been applied.</li> </ul>	<ul style="list-style-type: none"> <li>No sample compositing was carried out on site.</li> </ul>
ORIENTATION OF DATA IN RELATION TO GEOLOGICAL STRUCTURE	<ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> </ul>	<ul style="list-style-type: none"> <li>Drillholes were oriented to intersect the interpreted mineralisation zones as oblique (perpendicular) as possible. Orientated drill core collected by Vertex has confirmed the orientation of drilling.</li> <li>To the extent known, drilling is assumed to be unbiased.</li> </ul>
	<ul style="list-style-type: none"> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<ul style="list-style-type: none"> <li>No sampling bias is considered to have been introduced in drilling completed.</li> </ul>
SAMPLE SECURITY	<ul style="list-style-type: none"> <li>The measures taken to ensure sample security.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: Drilling and sampling was supervised and undertaken by company staff.</li> </ul>

CRITERIA	JORC Code Explanation	Commentary
AUDITS OR REVIEWS	<ul style="list-style-type: none"> <li>The results of any audits or reviews of sampling techniques and data.</li> </ul>	<ul style="list-style-type: none"> <li>Vertex drilling: Internal auditing procedures and reviews were regularly undertaken on sampling techniques, standard operating procedures, and laboratory processes.</li> </ul>

GEOLOGY	<ul style="list-style-type: none"> <li>Deposit type, geological setting, and style of mineralisation.</li> </ul>	<p>The Red Hill system lies within a mineralised corridor on the east limb of the Hill End Anticline. It is hosted by thin to thick bedded turbidites, massive quartzose feldspathic volcanoclastic sandstones, siltstone and shale of the Early Devonian (416-407 Ma) Crudine Group, metamorphosed to greenschist facies. The mineralised corridor generally parallels the axis of the Hill End Anticline, which strikes 020° and plunges gently to the north with a relatively broad, regular axial crest.</p> <p>A series of bedding-parallel NNW-striking, moderately east dipping gold mineralised shoots on the east limb of the Hill End Anticline are a single linked system of bedding-parallel quartz veins that carry shoots of high-grade Au mineralisation where they intersect a zone of low displacement faults that strike NNE and dip steeply east. The most significant high-grade Au-mineralised quartz veins within the mineralised corridor appear to be bedding-parallel, and are often in the immediate footwall or hangingwall of especially thick, coarse-grained mechanically strong turbidite units. Bedding dips relatively steeply (65°-90° east) within the mineralised zone at Red Hill, which is steeper than is expected for the local fold geometry (dip 45°-60° east. This suggests an additional structural influence whereby bedding has locally been rotated to be near-parallel to the cleavage as a result of the action of the low-displacement faults.</p> <p>The low displacement faults are poorly identified in outcrop and drill core, but appears to cause, or are localised by, a flexure or kink along a steeper-dipping portion of the eastern limb of the Hill End Anticline. This steepening of the east limb is most strongly developed in the Red Hill zone of the system, decreasing north through the Valentine into the Emily zone and south through White's zone. Vein sets within the Red Hill zone will intersect Indicator-type faults at a lower angle and have larger areas of intersection and reaction, resulting in greater tonnage of high-grade Au mineralisation.</p>																																																															
DRILL HOLE INFORMATION	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>Easting and northing of the drill hole collar.</li> <li>Elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar.</li> <li>Dip and azimuth of the hole.</li> <li>Down hole length and interception depth.</li> <li>Hole length.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Refer to Appendix 2.</li> </ul>
